STEELDAY

CISC Quality Certification Programs

The CISC has one of the most comprehensive, rigorous and independently audited quality certification programs in the industry. CISC Quality Certification provides proof of quality and competence for the construction industry, assuring organizations of adherence to national and international standards.

There are currently two CISC quality certification programs available: Steel Structures and Steel Bridges. These programs are specifically written for the steel industry and address specific issues related to steel fabrication. The programs are third party audited by two CISC approved auditing organizations with competency in the steel industry, ensuring a high degree of conformance and standardization.

In the past, it was confusing for specifiers wishing to include quality requirements in their projects. With the myriad of certification programs on the market, hundreds of registration bodies and the lack of auditor competency it was hard to choose. With the new CISC Certification programs, specifiers can now simply spec CISC Certification with the knowledge it covers all the quality requirements a steel fabricator is required to control. The structural steel fabricator's quality system shall be CISC Certified for Steel Structures.
